Assignment

Q.1. Compare e-waste of India with 5 other nations

→ According to paper, india is one of the fastest-growing e-waste generators, but its formal recycling system is still less developed than many developed countries. This rapid growth is driven by increasing population, urbanization, economic development and greater use of electronic devices.

- China is world's largest e-waste generator, producing about 10.1 million tonnes in 2019. It has established formal recycling infrastructure & legislation, although informal recycling still exists. The United states has stronger waste management regulations.

Germany, the United Kingdom and France achieve much higher formal recycling rates through effective collection systems and strict implementation of waste policies.

The paper concludes that india can improve its e-waste management by strengthening formal collection, recycling infrastructure & EPR implementation.

The comparison shows that although India's e-waste generation is increasing rapidly, its collection efficiency and formal recycling infrastructure lag behind developed countries.

DATE:

Q.2 Give 5 methods that can be implemented in India from the paper.

→ 1) Strengthen Extended Producer Responsibility (EPR):
Make producers responsible for collecting & recycling end of life electronic products.

2) Integrate informal sector:
Train & register informal recyclers to improve safe & efficient e-waste collection.

3) Develop advanced recycling infrastructure:
Establish modern recycling facilities for efficient recovery of valuable metals and safe disposal of hazardous materials.

4) Strengthen legislation and enforcement:
Improve monitoring and ensure strict implementation of e-waste management rules.

5) Increase public awareness:
Conduct awareness campaigns & expand authorized collection centres to encourage proper e-waste disposal
